3. Roles	3
4. UAT schedule	4
5. Test cases	5
6. Sign-off	8

1. Purpose and scope

User Acceptance Testing (UAT) confirms that the E-Invoice Module meets the business's needs before it goes live. While system testing verifies that the system works technically, UAT verifies that it works for the people who will use it and that it meets the requirements agreed upon in the Business Requirements Document and Functional Requirements Document.

This plan covers the invoicing, validation, rejection, outage, and audit-retrieval scenarios. It does not cover internal technical testing, which is handled separately by the development team.

2. Approach

- Business users run each test case using realistic sample data in a test environment.
- Each test case has a clear expected result from the agreed acceptance criteria.
- Testers record the actual result and mark each case as Pass or Fail.
- Failed cases are logged as issues, triaged, fixed, and retested.
- User Acceptance Testing is considered complete when all high-priority test cases pass and no critical or high defects remain open.

2.1 Entry and exit criteria

Entry criteria	Exit criteria
Functional testing is complete, the test environment is ready, sample data is loaded, and the testers are briefed.	All high-priority cases pass, no critical or high defects are open, and business sign-off has been obtained.

3. Roles

Role	Responsibility
Business users	Execute test cases, record results, and report issues.
Business Analyst	Owns the User Acceptance Testing plan, clarifies expected behavior, helps triage issues, and confirms exit criteria.
Development	Fixes defects and prepares the test environment.
Product Owner	Provides final business sign-off.

4. UAT schedule

UAT runs over a two-week window, scheduled to finish before the build's release date and the mandate deadline. Execution and defect fixing overlap, so that issues found early can be fixed and retested without waiting for the entire test run to finish.

Stage	Activities	Duration
Preparation	Load sample data, brief testers, and confirm that the test environment and entry criteria are met.	2 days
Test execution	Testers run all the test cases and record results.	4 days
Defect fixing	Development fixes failed cases, and high-severity defects are prioritized.	3 days (overlaps test execution)
Retest	Re-run failed test cases after fixes and confirm no new issues were introduced.	2 days
Sign-off	Confirm exit criteria are met and obtain Product Owner sign-off.	1 day

5. Test cases

Each test case is written to verify a specific user story and functional requirement. Testers fill in the Actual result and Status columns during execution.

TC-01 Configure the Tax Authority connection · High	
Precondition	A business account with no Tax Authority connection configured.
Steps	1. Input the required configuration details as an administrator. 2. Save the configuration. 3. Submit a Sales Invoice as a business user.
Expected result	Details are saved and validated. The user can submit Sales Invoices without configuring anything.
Actual result	
Status	

TC-02 Successfully save a Sales Invoice · High	
Precondition	A new Sales Invoice transaction is open for entry.
Steps	1. Create a Sales Invoice transaction. 2. Fill in all mandatory Sales Invoice details. 3. Save the transaction. 4. The system accepts and saves the Sales Invoice.
Expected result	The Sales Invoice is saved successfully with all mandatory fields captured, ready for submission.
Actual result	
Status	

TC-03 Block the saving of the Sales Invoice transaction when required fields are missing · High	
Precondition	A new Sales Invoice transaction is open for entry.
Steps	1. Fill in the Sales Invoice details but leave one or more mandatory fields blank. 2. Attempt to save the transaction.
Expected result	The system blocks the saving of the Sales Invoice transaction and prompts for the missing mandatory fields.
Actual result	
Status	

TC-04 Submit and validate a Sales Invoice · High

Precondition	A saved Sales Invoice transaction exists, and the Tax Authority test service is available.
Steps	1. Open a saved Sales Invoice transaction. 2. Submit the Sales Invoice for validation. 3. The system sends the information to the Tax Authority and shows the Pending status. 4. The Tax Authority returns a successful validation response. 5. The system updates the status to Validated and stores the validation reference number. 6. Open the generated validated e-invoice. 7. Verify that the validation reference number appears on the generated e-invoice.
Expected result	The status moves from Pending to Validated, a validation reference is stored, and it appears on the generated e-invoice.
Actual result	
Status	

TC-05 Handle a rejected Sales Invoice · High

Precondition	A saved Sales Invoice transaction exists, and the Tax Authority test service is set to return a rejection response.
Steps	1. Open a saved Sales Invoice transaction. 2. Submit the Sales Invoice for validation. 3. The system sends the information to the Tax Authority and shows the Pending status. 4. The Tax Authority returns a rejection response. 5. The system updates the status to Rejected. 6. Verify that the system displays a rejection message in plain language explaining the reason. 7. The user identifies the flagged field from the rejection message. 8. The user corrects the flagged field. 9. The user resubmits the Sales Invoice for validation. 10. The system sends the corrected information to the Tax Authority and shows the Pending status. 11. The Tax Authority returns a successful validation response. 12. The system updates the status to Validated and stores the validation reference number.
Expected result	The reason for rejection is shown in plain language. After correction and resubmission, the status becomes Validated.
Actual result	
Status	

TC-06 Queue a Sales Invoice during a Tax Authority service outage · High

Precondition	The Tax Authority test service is set to be unavailable.
Steps	1. Open a saved Sales Invoice transaction. 2. Submit the Sales Invoice for validation. 3. The system attempts to send the information to the Tax Authority. 4. The system detects that the Tax Authority is unavailable. 5. Verify that the system tags the Sales Invoice status as Pending. 6. Verify that the system queues the Sales Invoice for retry. 7. Verify that no data is lost during the downtime period. 8. Restore the Tax Authority system availability. 9. The system automatically detects that the service has been restored. 10. The system retrieves the queued Sales Invoice and resubmits it to the Tax Authority. 11. The Tax Authority returns a successful validation response. 12. The system updates the status to Validated and stores the validation reference number. 13. Verify that the Sales Invoice was submitted without any manual intervention from the user.
Expected result	The Sales Invoice is queued with a clear message, and once the service returns, it submits automatically with no data loss.
Actual result	
Status	

TC-07 Retrieve a Sales Invoice for audit purposes · Medium

Precondition	A Sales Invoice exists with a full submission history, including the Pending, Rejected, and Validated status.
Steps	1. Open a Sales Invoice transaction. 2. Navigate to the status history section. 3. Verify that the full submission history is displayed in chronological order. 4. Verify that each status entry shows the status label, such as Pending, Rejected, or Validated. 5. Verify that each status entry shows a timestamp of when the status changed. 6. Verify that the validation reference number is present on the Validated entry. 7. Verify that no status entries are missing or out of order.
Expected result	The full submission history is displayed in chronological order, with each entry showing the correct status label and timestamp. The validation reference number is present on the Validated entry, with no missing or out-of-order entries.
Actual result	
Status	

TC-08 View validation status across Sales Invoices · Low	
Precondition	At least one Sales Invoice exists for each status: Validated, Pending, and Rejected.
Steps	1. Open the Sales Invoice list. 2. Filter by status.
Expected result	Each Sales Invoice shows the correct status, and filtering returns the right Sales Invoices.
Actual result	
Status	

6. Sign-off

User Acceptance Testing is complete when the exit criteria are met. The sign-off below confirms that the module is accepted for release to live production.

Name	Role	Sign-off date
Daniel Reyes	Product Owner	
Ma. Atheagem Pasamonte	Business Analyst
