Daniel Reyes	Product Owner
Sofia Mendoza	Compliance Lead
Marcus Tan	Development Lead

1. Summary

Brightbooks is a cloud-based platform for small and mid-sized businesses used to create, send, and track invoices to clients. An upcoming national e-invoicing regulation will require businesses to issue electronic invoices that are validated and reported to the Tax Authority at or near the time of the sale, replacing traditional print invoices.

Brightbooks' current sales module cannot generate this electronic invoice format, send invoices to the Tax Authority, or process the validation responses. Unless the system adapts before the mandate takes effect, Brightbooks customers will be unable to issue compliant invoices, exposing them to penalties and creating a strong reason for users to switch to a competitor that is already compliant.

This document defines the business requirements for E-Invoice Compliance that enables Brightbooks customers to generate, validate, transmit, and track compliant electronic invoices while preserving the simple invoicing experience they rely on today. This project has to balance two things that don't always align: strict regulatory compliance and a simple user experience. When these two conflict, compliance wins because a business has to be legal first. Everywhere else, we keep things fast and easy for users.

2. Problem Statement

Currently, a Brightbooks user creates an invoice and sends the printed copy to the customer. The invoice is recorded in the user's books, but no information is sent to the Tax Authority when it is issued. Tax reporting happens later, in the periodic filings.

Under the new regulation, this approach is no longer allowed for affected businesses. Each invoice must now be:

- Generated in the required electronic format.
- Submitted to the Tax Authority for validation before or at the moment it is issued to the buyer.
- Assigned a unique validation reference number by the Authority, which must appear on the invoice given to the buyer.
- Kept secure so any later changes can be detected, and easy to retrieve if the Tax Authority inspects the business's records.

As of now, Brightbooks cannot perform any of these four steps. This project resolves a compliance gap in which customers cannot meet their legal obligations and a retention risk in which non-compliant software loses customers to compliant competitors.

3. Objectives

The project will be considered successful if it achieves the following measurable outcomes:

#	Objective	Metric	Target
O1	Enable customers to issue compliant e-invoices before the mandate date	Compliance readiness	All affected customers are able to issue compliant invoices by the mandate date
O2	Preserve invoicing simplicity	Avg. time to create and issue an invoice	No more than 20% longer than the current flow
O3	Minimize failed submissions	Invoice rejection rate by the Tax Authority	Under 2% of submissions rejected
O4	Protect customer retention	Customers lost due to compliance gaps	Zero customers lost
O5	Keep records audit-ready	Invoices are retrievable within the retention period	100% retrievable with full status history

4. Scope

4.1 In scope

- Generating invoices in the required electronic format.
- Submitting invoices to the Tax Authority and receiving the validation responses.
- Displaying validation status (Validated, Pending, Rejected) in the system.
- Handling rejected invoices so users can correct and resubmit.
- Storing validated invoices and their status history for the required retention period.
- Setting up a one-time connection in which a business enters the details required by the Tax Authority.

4.2 Out of scope

- Changes to other Brightbooks modules (Customer Details, Receive Payment, Reports), though the invoice may still pull data from them.
- Tax calculation logic beyond what already exists in the current Sales Invoice.
- Support for jurisdictions beyond the covered mandate. The design should allow additional jurisdictions to be added later, though these are not part of the current scope.
- Migrating historical invoices issued before the mandate into the new format.

5. Stakeholders

The table below identifies the key stakeholders for this project and their primary interests.

Name	Role	Primary interest
Brightbooks customers	End users	Issuing invoices quickly and staying compliant
Daniel Reyes	Product Owner	Customer retention, on-time delivery, scope control
Sofia Mendoza	Compliance Lead	Accurate interpretation of the regulation
Marcus Tan	Development Lead	A buildable and maintainable solution
Lena Cruz	Customer Support Lead	Adequate resources to handle user questions at launch
Ryan Santos	Quality Assurance Lead	A testable solution with clear acceptance criteria
Isabel Navarro	Information Security Lead	Data protection and secure integration with the Tax Authority

6. Business Requirements

This table lists what the business needs from the system. Detailed system behavior is specified in the Functional Requirements Document (FRD).

ID	Business Requirement	Linked objective
BR-01	Customers must be able to generate an electronic invoice in the format mandated by the Tax Authority.	O1, O3
BR-02	The system must be able to submit invoices to the Tax Authority and obtain a validation reference number before the invoice is considered issued.	O1, O3
BR-03	Users must clearly see whether an invoice is Validated, Pending, or Rejected.	O1, O2, O4
BR-04	When an invoice is rejected, the user must be informed and given an option to correct and resubmit it.	O3, O4
BR-05	Issuing a compliant invoice must not increase the time required to enter data compared to the current invoicing workflow.	O2, O4
BR-06	Validated invoices and their full status history must be retained and readily retrievable for audit purposes.	O1, O5
BR-07	A business must be able to configure its required information once to transact with the Tax Authority.	O1, O2
BR-08	If the Tax Authority system is temporarily unavailable, the Brightbooks system must tag the invoice status as Pending and automatically submit them upon system restoration without data loss.	O1, O3, O4

7. Assumptions, Constraints and Dependencies

7.1 Assumptions

- The Tax Authority will provide a stable system and technical specifications in accordance with the mandated regulation before development begins.
- The mandatory fields required by the Tax Authority's new regulation for the Sales Invoice can be entered by the user in Brightbooks.
- Customers have reliable internet access when invoices are issued.

7.2 Constraints

- The project must be live before the mandate's effective date.
- The updated Sales Invoice must work within Brightbooks' existing invoicing workflow.

7.3 Dependencies

- Availability and stability of the Tax Authority's validation system.
- Final published version of the regulation's technical specification.

8. Key Risks

This table identifies the key risks to the project and the proposed mitigation for each risk.

#	Risk	Impact	Mitigation
R1	Tax Authority specification changes are late.	High	Isolate the specific logic for the Tax Authority to contain changes and monitor specification updates weekly.
R2	Tax Authority has service outages at launch.	High	Implement a queuing and retry structure with clear status messaging to keep users informed during outages.
R3	Users are overwhelmed by the new steps.	Medium	Ensure the invoicing process remains familiar to users with as few additional steps as possible to meet e-invoice compliance.
R4	Rejected invoices cause confusion among users, leading to a spike in support tickets.	Medium	Provide easy to understand rejection messages and a knowledge base for support teams before launch, which should also be available to customers after deployment.

9. Timeline

The timeline below indicates the duration of each phase with its high-level activities.

Phase	Key activities	Duration
Business and Requirements Analysis	Meeting with the Stakeholders, Tax Authority Regulation Analysis, and Business Requirements Document	Weeks 1–3
Requirements Gathering	Functional Requirements Document, User Stories, Business Process Models, and Wireframes	Weeks 4–6
Build	Development of E-Invoice Compliance	Weeks 7–12
Testing and UAT	Test Cases, Defect Resolution, and User Acceptance Testing	Weeks 11–15
Go-Live and Support	Go-Live Rollout, Monitoring, and Support Readiness	Weeks 16–17

10. Glossary

Term	Definition
Business Requirements Document (BRD)	A document that captures the high-level business needs for a project.
E-invoice	An invoice issued in an electronic data format that can be processed automatically.
Functional Requirements Document (FRD)	Specifies how the system must behave to meet the business requirements.
Requirements Traceability Matrix (RTM)	Links each requirement to its design and tests.
Retention Period	The period that documents are kept and available for inspection before they can be deleted.
Status History	The full record of an invoice's status over time, such as Pending, Validated, or Rejected, including each submission attempt.
Tax Authority	The government body responsible for receiving, validating, and recording invoices under the e-invoice regulation.
User Acceptance Testing (UAT)	The process of testing that the system meets business needs before release.
Validation Reference Number	A unique identifier issued by the Tax Authority confirming that an invoice has been accepted. This must appear on the buyer's copy.
