Case Study

E-Invoice Compliance for Brightbooks

Client	Brightbooks is a cloud invoicing platform for small and mid-sized businesses.
Challenge	A new e-invoicing regulation that the platform could not meet, putting its current customers at risk of penalties.
My role	As the Business Analyst, I handled discovery, requirements, business process mapping, and UAT.
Method	Delivered in stages against a fixed compliance deadline.
Deliverables	Business Requirements Document, Current and Proposed Process Flows, Functional and Non-Functional Requirements, User Stories, Data Structure, Requirements Traceability Matrix, User Acceptance Testing Plan, and Issue Log.

Problem

Brightbooks customers create invoices, send a copy of the invoice, and report their taxes later in periodic filings. An upcoming regulation requires that every invoice be generated electronically, validated by the Tax Authority at or near the time of sale, and stored for audit purposes. The platform currently cannot do any of this. Without an enhancement, customers could not issue compliant invoices. Many would have strong reason to switch to a competitor that already complied.

Approach

- Ran discovery with stakeholders to understand the regulation and the current process.
- Mapped the current invoicing workflow and designed a compliant workflow that kept the familiar Sales Invoice steps.
- Wrote the Business Requirements Document, Functional and Non-Functional Requirements, and User Stories with testable acceptance criteria.
- Designed how invoice data is stored in the system, including a log that records every submission to the Tax Authority for audit purposes.
- Built a Requirements Traceability Matrix and User Acceptance Testing Plan, then validated the build against the requirements I had written.

Outcome

Every requirement had a matching test case with no gaps. UAT caught a critical defect in which queued invoices were not auto-submitting after an outage, and it was fixed before release. The final solution met the regulation without significantly slowing the invoicing process.
